

### **Week 2 Project**

You have been tasked to use Terraform to spin up two nodes. One node should run Apache web server and the other node should run Nginx web server.

Infrastructure setup should be completely via Terraform. You may leverage existing Security Group, key-pair, and subnet.

Bonus point: See if you can access installed Apache and Nginx via your browser after completing the exercise.

You can leverage this:

<https://www.terraform.io/docs/provisioners/remote-exec.html>

Please use Google generously and the forum.
